What is MoEIS ?

MoEIS is the Missouri Emissions Inventory System

MoEIS was developed in response to the previous Paradox database that was used by the Air Program. It had outlived its usefulness because of a combination of issues such as Y2K, bugs in the system, and the fact that Paradox was unfamiliar to many of the users.

MoEIS integrated all of the old Paradox emissions data for multiple years and made it available for all that had access to the system. The in-house MoEIS program has been used since 1999 to enter and store the EIQ data. Now that the stability and confidence in MoEIS has been established, a Web-based application has been developed for the regulated community to use and enter their EIQ data.
